Least squares approximation

1. The following table list the temperatures of a room recorded during the time interval $[1 : 00, 7 : 00]$. Find the best linear least squares function $\varphi(x) = ax + b$ that approximates the table, using the normal equations (equations (2) from Course 6). Use your result to predict the temperature of the room at $8 : 00$. Find the minimum value $E(a, b)$, for the obtained a and b . In the same figure, plot the points (Time, Temperature) and the least squares function.

Time	1 : 00	2 : 00	3 : 00	4 : 00	5 : 00	6 : 00	7 : 00
Temperature	13	15	20	14	15	13	10

2. The vapor pressure P of the water (in bars) as a function of temperature T (in $^{\circ}C$) is:

T (temperature)	0	10	20	30	40	60	80	100
P (pressure)	0.0061	0.0123	0.0234	0.0424	0.0738	0.1992	0.4736	1.0133

a) Obtain two least squares approximations for the given data, using *polyfit* for 2 different degrees of the polynomials. Find their values for $T = 45$ using *polyval*. Compute the approximation errors, knowing that the exact value is $P(45) = 0.095848$.

b) Plot the interpolation points, the least squares approximants and the interpolation polynomial, in the same figure.

3. Consider 10 random points in the plane $[0, 3] \times [0, 5]$ using Matlab function *ginput*. Plot the points and the least squares polynomial of 2nd degree that best fits these points.

Facultative:

4. Consider 12 random points in the interval $[0, 10]$. Find the discrete least squares approximant of n -th degree for the function $f(x) = x^3$ using the least squares approximation method with weight function $w(x) = 1$ and the basis $1, x, x^2, \dots, x^n$. (The least squares approximant is of the form $\varphi(x) = \sum_{i=1}^n a_i g_i(x)$, where $\{g_i, i = 1, \dots, n\}$ is a basis of the space and the coefficients a_i are obtained solving the normal equations: $\sum_{i=1}^n a_i \langle g_i, g_k \rangle = \langle f, g_k \rangle, \quad k = 1, \dots, n$). Plot the obtained approximant.
